

Exploring the Number "e" Lab

Part 1 - Finding a Maximum Value

1. In the space at right, graph the function $f(x) = x^{\frac{1}{x}}$.

a. Use the trace feature of your calculator to get an estimate of the maximum point (3 decimal places).

Estimated maximum point (_____ , _____).

[0, 5] x [0, 2]

b. Now, use the **CALCULATE** feature of your calculator to find the maximum point. Go to **2nd TRACE** for **CALCULATE** and select **4** for **maximum**. Follow the directions on the screen. Be sure you're to the **left of the max** (lower bound) and then to the **right of the max** (upper bound).

Actual maximum point (_____ , _____) to the billionths place.

c. Make a conjecture as to the **exact value** of the x -value and y -value of the maximum point.

Part 2 - Another Name for the Function e^x

2. In 1748, **Leonhard Euler** (pronounced "oiler"), published a work in which he developed an irrational number that ranks along with π in importance. In his honor the number is called e , the **Euler number**. One way that e can be found is by finding the "limit" of the following infinite series.

$$e = 1 + \frac{1}{1!} + \frac{1}{2!} + \frac{1}{3!} + \frac{1}{4!} + \frac{1}{5!} + \dots + \frac{1}{(n-1)!} + \dots$$

Note: As an example, $4! = 4 \times 3 \times 2 \times 1$.

a. Write out the first six terms of the series.

b. Is the series arithmetic or geometric? Explain

To access "!", the factorial symbol, press **MATH**, arrow to **PRB**, and select **4**.

Exploring the Number "e" Lab

- c. Evaluate the expression for the number of terms given in the table below. To do this, go to the home screen of your graphics calculator and do the following:

```
NAMES OPS MATH
1:min(
2:max(
3:mean(
4:median(
5:sum(
6:Prod(
7:stdDev(
```

Press **2nd STAT** for **LIST**. Arrow to **MATH** and select **5** for **sum** and press **ENTER**.

```
sum(
```

Depending on your calculator, you should see this on your home screen.

```
NAMES OPS MATH
1:SortA(
2:SortD(
3:dim(
4:Fill(
5:seq(
6:CumSum(
7:List(
```

Press **2nd STAT** for **LIST**. Arrow to **OPS** and select **5** for **seq** and press **ENTER**.

```
sum(seq(
```

Depending on your calculator, you should see this on your home screen.

```
sum(seq(1/(X-1)!,
,X,1,5,1)
```

Type in the above information to find the sum of the first 5 terms of the series.

```
sum(seq(1/(X-1)!,
,X,1,5,1)
2.708333333
```

When you press **ENTER**, the sum of the first 5 terms is shown.

```
sum(seq(1/(X-1)!,
,X,1,5,1)
2.708333333
sum(seq(1/(X-1)!,
,X,1,6,1)
```

Press **2nd ENTER** to bring back your last entry. Arrow to the 5 and change it as needed.

Number of terms	Sum of the series (write down all decimal places shown)	Number of terms	Sum of the series (write down all decimal places shown)
5		9	
6		10	
7		15	
8		20	

- d. What's the **minimum** number of terms that must be added so that the sum of the series represents e to nine (9) decimal places?
- e. Does the limit of the series seem to "converge" to its limiting value, e , quickly?

Exploring the Number "e" Lab

Part 3 - Using the Slope Feature

3. Consider the following function $f(x) = 1 + \frac{x}{1!} + \frac{x^2}{2!} + \frac{x^3}{3!} + \frac{x^4}{4!} + \dots + \frac{x^{n-1}}{(n-1)!} + \dots$.

a. Fill in the table below by evaluating $f(x)$ at the x -values shown in the table.

<pre>1+sum(seq((-4)^N /N!,N,1,20,1) .0183157117</pre>	<pre>1+sum(seq((-4)^N /N!,N,1,20,1) .0183157117 1+sum(seq((-3,5) ^N/N!,N,1,20,1) .0301973879</pre>
---	--

Follow the procedure shown at the left. Use the **2nd ENTER** feature to bring back the last entry and edit it for the next x -value.

(1) Why is "N" used rather than "N-1" for the expression shown on the screen?

(2) How many terms are you adding in the procedure to get an approximation for $f(x)$?

Value of x	Value of $f(x)$ to 5 decimal places	Value of x	Value of $f(x)$ to 5 decimal places
-4.0		0.5	
-3.5		1.0	Neat!
-3.0		1.5	
-2.5		2.0	
-2.0		2.5	
-1.5		3.0	
-1.0		3.5	
-0.5		4.0	
0.0		4.5	

b. Go to **STAT Edit** and enter the values of x in L_1 and the values of $f(x)$ in L_2 . Use the **STAT PLOT** feature to graph the function. **Turn off the axes.**

```
5:1:Plots
1:Plot1...Off
  L1 L2
2:Plot2...Off
  L3 L4
3:Plot3...Off
  L5 L6
4:PlotsOff
```

```
Plot1 Plot2 Plot3
Off Off Off
Type: [ ] [ ] [ ]
Xlist:L1
Ylist:L2
Mark: [ ] [ ] [ ]
```

```
2:000 MEMORY
4:2:Decimal
5:2:Square
6:2:Standard
7:2:Trig
8:2:Integer
9:ZoomStat
0:ZoomFit
```

```
RectGC PolarGC
CoordOn CoordOff
GridOff GridOn
AxesOn AxesOff
LabelOff LabelOn
ExprOn ExprOff
```

Exploring the Number "e" Lab

- c. Enter the function $g(x) = e^x$ in the **Y=** screen and graph it. (Keep the axes off.) What's the relationship between $f(x)$, the function determined by the series, and $g(x)$?
- d. Use your graphing calculator's **sum(** and **seq(** features to see if the equation $e^x = 1 + \frac{x}{1!} + \frac{x^2}{2!} + \frac{x^3}{3!} + \frac{x^4}{4!} + \dots + \frac{x^{n-1}}{(n-1)!} + \dots$ would give calculator manufacturers a good approximation formula for e^x .

4. Enter the function $g(x) = e^x$ in the **Y=** screen and graph it. (Be certain to turn off any **STAT PLOTS** that are on.) Use the window settings shown at right and keep the axes turned off.

```

WINDOW
Xmin=-4.7
Xmax=4.7
Xscl=1
Ymin=-6
Ymax=50
Yscl=5
Xres=1
    
```

- a. The **slope feature**, often denoted dy/dx , is read as "the change in y over the change in x ." It calculates the slope of the line that is tangent to a given graph at a given point.

You access the slope feature by pressing **2nd TRACE** for **CALCULATE**, arrowing to **6** for **slope**, and pressing **ENTER**. Use this feature to fill in the table below.

```

2nd TRACE
1:value
2:zero
3:minimum
4:maximum
5:intersect
6:dy/dx
7:f f(x)dx
    
```

Note: Write down ALL decimal places.

x-value	y-value	dy/dx
-2.0		
-1.4		
-1.0		
0.0		
0.7		
1.0		
2.3		
3.6		

Press **TRACE**, enter the value **-2**, and press **ENTER**.

Press **2nd TRACE** for **CALCULATE**, arrow to **6** for **slope**, and press **ENTER** for dy/dx .

- b. What do you notice about the y -value and $\frac{dy}{dx}$?

- c. Does this work for any function or is $g(x) = e^x$ a **very** special function?
