

Potential Problems to Keep in mind

- Multi colinearity.
 - Two variables that move together frequently (correlated)
 - ↳ "Steal" significance from one another.

Omitted Variables

If there is a variable that "matters" that we leave out of our regression model, its effect will show up in the coefficients of other, correlated, variables that are in the model. **Bias**

Model Selection

- Which data to use?
 - Just use Nbd 4?
